Truly Centralized Administration of Microsoft SharePoint Deployments

DocAve Administrator for SharePoint is designed to give organizations universal control over their enterprise-wide SharePoint environments, from an individual farm to hundreds of farms, all from a single interface.

Leveraging DocAve's unique distributed architecture, the module offers a central console for administrators to easily view, search, manage, report, and replicate settings, configurations, and securities of SharePoint objects (individually or in bulk). You can apply rule-based searches across all SharePoint deployments – from farms, web applications, site collections, sites, down to the folder and list level – and deploy configurations and security permissions to the search results either in bulk or selectively. Searches can even be saved and used again. Securities and configurations can now be easily managed and applied at the item-level across all of your SharePoint deployments.

Business Advantages

- **Improve IT productivity and reduce administration costs**

DocAve Administrator allows instant discovery of new sites, control of access permissions for each level of responsibilities, and completely centralizes management and application control. It reduces costs associated with deployment and management of a complex infrastructure, regardless of the number of servers or farms.

- **Simplify and unify management across entire SharePoint deployments**

Administrators can easily identify SharePoint assets dispersed across the enterprise using a rule-based search, and propagate configuration and security permissions to web applications, sites, folders, and lists in bulk or selectively, resulting in quicker time-to-value of each update.

- **Reduce security, compliance, and performance risks**

DocAve Administrator simplifies user security management, usage and storage monitoring, and global policy control. It facilitates the deployment of policies that are normally difficult to implement and control across an entire enterprise. Also, security permissions can be applied granularly at the item-level across all SharePoint deployments.

*As with all AvePoint software, the DocAve Software Platform leverages only fully supported Microsoft methodologies and API's.

Functions of DocAve Administrator

Administration and Security Management

- Perform all SharePoint *Central Administration* functions across multiple web applications and farms at any SharePoint object level from a unified interface.
- Manage configurations, security, solutions and features globally with easily defined groupings of sites or farms for simplified management by the type of environment, physical location, or business function.
- Simplify selection of SharePoint objects with rule-based search of SharePoint assets and rule-based user security search in a global environment.
- Easily search, identify, and execute upon Dead Accounts in SharePoint.

Management and Reporting

- Schedule all administrative functions for the environment or components of the environment and enforce policies.
- Obtain enterprise reports on SharePoint system health, action history, archived content, and detailed item reports.
- Give security-trimmed access for site collection owners to view and manage only their SharePoint content, or designate custom security group roles to better distribute administration.

Supported Environments

Microsoft SharePoint Server 2010

Microsoft Office SharePoint Server 2007

Microsoft SharePoint Foundation

Windows SharePoint Services v3
