

Microsoft® SharePoint® and Office 365 Migration with DocAve Livelink Migrator

Quickly consolidate enterprise content from OpenText® Content Server (Livelink) into Microsoft SharePoint Server and SharePoint Online.

Key Benefits

Pre-Migration Discovery

Inventory source environments with detailed discovery and pre-scan, to inform your migration project planning – including required mappings, prioritization, and content or customizations requiring re-work.

Legacy Asset Protection

Protect investments in Livelink content with lossless migration into SharePoint. Transfer Livelink content to SharePoint in an organized and efficient manner to improve IT productivity and reduce the time-to-value for deploying SharePoint of Office 365.

Legacy Asset Protection

Minimize business user interruption by ensuring critical information residing in legacy content sources – including all associated metadata – is preserved and available in SharePoint or Office 365.

High Speed Migration to Office 365

Migrate large quantities of content from Livelink to Office 365 more than ten times (10x) faster than before, while ensuring full fidelity around your content, overcoming throttling limitations and accelerating your cutover to the cloud.

Migration To SharePoint Made Easy

OpenText Content Server (Livelink) has been used in the past as a knowledge collaboration, information retrieval, and business process automation platform. In recent years, however, many organizations have recognized SharePoint's superior capabilities in these areas and are looking to migrate their Livelink data into SharePoint Server 2016, SharePoint Server 2013, SharePoint Online and OneDrive for Business. DocAve Livelink Migrator provides an efficient and cost-effective approach to seamlessly migrate from Livelink to SharePoint.

Pre-Migration

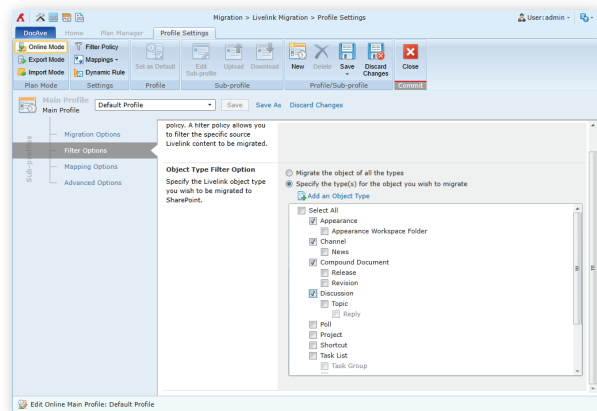

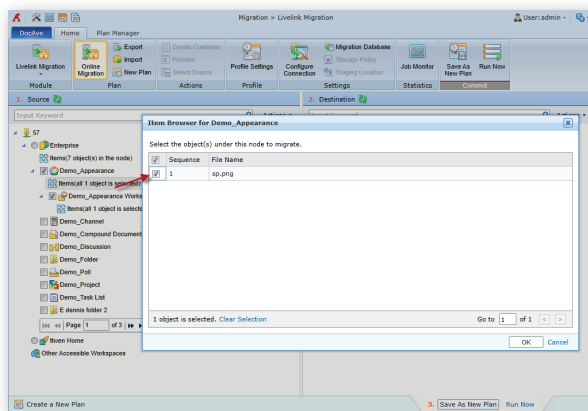

- Delegate migration plan management based on administrative roles
- Scan source content prior to migration to identify the scope of migration, and detect any illegal characters, user permissions, user names, user domains, and other Livelink elements that must be mapped in order to migrate successfully into SharePoint or Office 365
- Configure migration plans according to business needs with granular content selection, as well as customizable filtering options based on content properties, and perform test runs to validate migration plan configuration
- Bring your own Azure storage, or let DocAve automate the creation, encryption, and disposition of temporary Azure storage required for high-speed migration at no extra cost

Migration with Full Fidelity

- Preserve all metadata – including security settings, attributes, and properties – with full fidelity, utilizing customizable mappings to properly represent Livelink elements and quickly take advantage of SharePoint and Office 365's features such as managed metadata
- Extract data – including enterprise workspaces, domain workspaces, my workspaces, projects, channels, discussions, polls, task lists, task groups, tasks, milestones, compound documents, appearances, folders, appearance workspace folders, URLs, short cuts, generations, text documents, document versions, XML DTD, categories, category versions, and permissions – from Livelink with all associated metadata and migrate it to its mapped SharePoint objects
- Perform full and subsequent incremental migrations to keep network bandwidth resources optimized, only migrating content that has been updated since the last migration
- Automate construction of your new SharePoint environment on-the-fly during your migration
- Migrate online over existing networks, or offline to securely migrate data across firewalls
- Migrate into pre-created sites, or create containers on the fly

Optimized User Experience

- Automatically compress and migrate files that are natively blocked by SharePoint 2016, SharePoint 2013, or SharePoint Online
- Create dynamic rules based on out-of-the-box interfaces to customize mappings and filter policies in order to meet specific business needs, including the ability to create new Managed Metadata, merge/split columns, and replace column values in the destination

Point-and-click migration simplifies the transfer of content into SharePoint.
