

Compliance Guardian 3

Release Notes

Service Pack 1, Cumulative Update 1

Issued August 2013

New Features and Improvements

- Added the Site Quality test suite in the built-in Compliance Guardian package.
- Added the Australian Personal Information test suite in the built-in Compliance Guardian package.
- Added the Filter element in the Element type check and EnhancedElement check to further refine True/False conditions.

Known Issues

- In the exported Risk Report of Compliance Scanner for Websites, there are no values in the **Created By** column and the **Last Modified** column.
- If you install the Compliance Guardian 3 SP1 package on a machine with Windows Server 2012 or Windows Server 2008 installed, an error page may appear, and the Compliance Guardian Manager will not open. As a workaround, navigate to **IIS Manager > Application Pools**, open **ContentCompliance**, and then select **Advanced Settings**. In the Advanced Settings interface, change the .NET Framework version to 4.0.
- In Compliance Scanner for Websites, if there are multiple concurrent threads for crawling webpages, some errors may occur during the crawling job for the scan if the Web server cannot accept multiple connections. The following error message will appear: **Unable to read data from the transport connection: An existing connection was forcibly closed by the remote host**. The issue occurs because we send multiple requests to the server, but the server cannot respond to the requests.
- The source code of an ASPX file downloaded from SharePoint is different from that in the corresponding Error Highlight Report. The source code of the ASPX file is parsed by IIS and then sent to the client, so it is not the same as the code downloaded from SharePoint.
- In Compliance Scanner for File System and Scheduled Classification Scanner for File System, you can define a filter policy with a condition that looks at the connection name, but that condition will be ignored in the filter policy. The connection name will not be filtered out by the filter policy; it is not affected by the filter policy.
- If you apply a Real-Time Classification Scanner rule to a library, the tag will be added to the file and SharePoint according to the scan policy in the rule. In SharePoint, if you select the library and select **New Document** on the ribbon, the tag cannot be added to the newly created document and cannot be added to SharePoint.
- If you enter an HTML file's Error Highlight Report page after scanning the file, a message appears to prompt the user that the report is not accurate. If the user uses the SSL type check, this issue will appear.
- When there are a large number of violations (more than 3500) in a file, after entering the corresponding Error Highlight Report page, the page does not respond.

- When you upgrade Compliance Guardian 3 CU1 to 3 SP1, the corresponding test suites are not displayed in the Risk Report for the files from Compliance Guardian 3 CU1. The function of displaying the file's test suite in the Risk Report is a new feature in 3 SP1, so the data from 3 CU1 does not have the corresponding test suite information.
- The incremental Scheduled Classification Scanner job will scan the files that were tagged by the previous job even if they have not been edited by any other process.
- If the user selects **Certificate** as the **Authentication** method to run a Compliance Scanner for Website job, the agent account should be the current login user, or the agent account should be a member of the local **Administrators** group of the server where the Compliance Guardian agent is installed.
