

# DocAve<sup>®</sup> Online 3

## Release Notes

Service Pack 6 Cumulative Update 2

Issued December 2014

## New Features and Improvements

- Support deleting data that was backed-up by an Exchange Online Backup & Restore plan, together with the plan's related job records and job reports. The user can also choose to remove the plan from DocAve Online during the data deletion.
- Support using wildcards (? and \*) to search for site collections, OneDrive for Business, and mailboxes when registering site collections, OneDrive for Business, and mailboxes by scan.
- Improvements to search function in User and Group section of Security Search to enable users to enter more than three usernames or group names.

## Known Issues

- DocAve Online does not support restoring the SharePoint Online App or AppData backup data from one site collection to another site collection that is in a different tenant group.
- When configuring the physical device of the SFTP storage type and the SFTP server is freeSSHd, testing both the Password and the Private Key File (a .ppk file) at the same time will fail the test. DocAve Online SFTP only supports the private key file in .openssh format. The private key files in .ppk format generated by PuttyGen are not supported. As a workaround, if your private key file is in .ppk format, use PuttyGen to convert it to an .openssh file.
- If the network environment is not stable, the message bar indicating that the job for exporting report is started may not appear. However, the job is actually started and you can view the job in Job Monitor.
- If the SharePoint Online site collection URL contains the special character "~", the storage quota of the site collection cannot be reported in the **Report Center > Administration Report > Configuration Report**. This issue is caused by a SharePoint Online API limitation.
- If a user creates a plan or profile with a name that contains "workflow;open a", an error message appears after saving the plan or profile. The words "workflow;open a" trigger the rule of Windows Firewall.
- DocAve Online only supports users with site collection administrator or above permissions to register SharePoint Online site collections.
- All OneDrive for Business site collections have a storage capacity limit of 1TB.
- DocAve Online does not support restoring the Approval Status of the items in Discussion Board.
- Breaking the inheritance of a list that contains more than 5,000 items through SharePoint Online will fail a job. This issue is due to a SharePoint Online limitation.
- Due to a SharePoint Online client API limitation, the properties of **Number of items to display in list view web part for this view: and Field to display in mobile list simple view:** cannot be obtained for backup.

- When configuring a filter policy for the **Number** column with a percentage, the column value must be in a decimal format instead of a percentage in order for the filter policy to be configured correctly and properly run any jobs.
- When merging a source site to a destination site collection, the source site administrator is not promoted to the destination site collection administrator, and therefore the source site administrator cannot access the destination site collection. The source site inherits permissions from its site collection. As a workaround, copy/move all of the source permissions to the destination, and select the source site collection as the source node.
- Site language settings cannot be backed up or restored due to a limitation of SharePoint API. **SharePoint API. SharePoint.Client.Web** does not have the `AlternateUICultures` attribute. For example, if you configure the language settings in a source team site, use Content Manager to attach the source site to a destination site, and set **Merge** as the container level conflict resolution and **Overwrite** as the content level conflict resolution, the source language settings are not copied to the destination.
- Limited Access permission is not supported for restoring due to a Client API limitation. For example, in a source site, if you break the permission inheritance of an item, add a security group, edit the permissions (Limited Access permission is a mandatory selection by SharePoint Online), and use Content Manager to merge the source site to a destination site selecting **Merge** as the container level conflict resolution and **Overwrite** as the content level conflict resolution, the Limited Access permission is not copied to the destination.
- Audit settings are not supported for restoring. The source site collection audit setting cannot be backed up and restored to a destination. Due to limitations of the Client API, **Microsoft.SharePoint.Client.Site**'s attribute of **Audit**, **TrimAuditLog**, and **Site.AuditLogTrimmingRetention** cannot be retrieved during a restore.
- Personal View is not supported because it is a private resource and cannot be accessed by other users. For example, if you select a list as the source node, manually enter the list as the destination node, select **Merge** as **Container level conflict resolution** and **Overwrite** as **Content level conflict resolution** in **Wizard Mode**, select **Include list view**, and then run a copy or move job, the Personal View of the user who does not register site collections is not copied or moved to the destination.
