

# Release Notes

**Package: Full Package**

**Release Date: March 29th, 2011**

**Product: DocAve v5.6.1 Platform**

## New Features

- Please refer to the **DocAve 5.6.0 Release Notes** for the list of recently added Features.

## Bug Fixes

- **Enterprise Keywords Migration/Content Management for SharePoint 2010 customers**

Previously, an unexpected behavior arose when migrating from an environment that did not have Enterprise Keywords enabled, and selecting to migrate both content and components to a location with Enterprise Keywords enabled. Running a plan with this configuration would also overwrite the Enterprise Keyword configuration in the destination environment, unexpectedly removing those terms and the Enterprise Keyword configuration. DocAve 5.6.1 will not overwrite these settings in the destination environment, preserving the Enterprise Keywords that have been enabled.

- **Corrected functionality for SharePoint 2010 Managed Metadata Columns**

Previously, when attempting to manage or restore content to environments which have Enterprise Keywords enabled, columns in the destination environment that utilized these managed keywords we're not able to be overwritten due to the controls enabled by the Managed Metadata service. Additionally, due to changes made during the restore of this content to SharePoint, these columns we're also not able to be modified once a job completed. This issue has been addressed in DocAve 5.6.1, and these columns are able to be successfully moved with DocAve.

## Known Issues

- Please refer to the **DocAve 5.6.0 Release notes** for the list of Known Issues
