

Virtual Machine Data Protection

with DocAve VM Backup and Restore

Reliable and flexible protection for your virtualization platform.

Key Benefits

Virtual Machine (VM) Assets Protection

Protect your organization from disasters with comprehensive backup and recovery for your assets in EMC® VMware or Microsoft® Hyper-V hosted VMs.

Business Continuity

Minimize business disruptions caused by service interruptions or accidental deletions with efficient recovery of the entire VM environment or individual files.

Infrastructure Costs Reduction

Encourage the adoption of virtualized servers to host your business-critical IT systems with unprecedented comprehensive protection and management of all of your VMs, lowering the cost of infrastructure and maintenance.

All-in-one SharePoint Rebuild

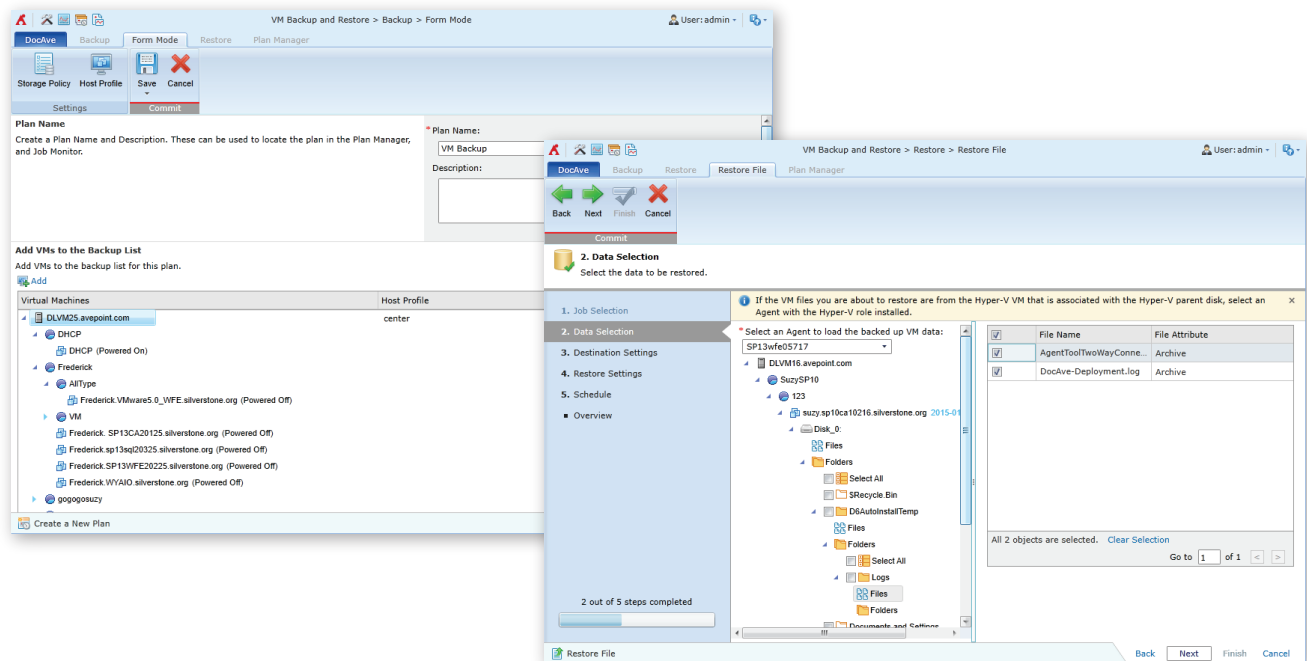

Enable truly comprehensive SharePoint data protection with backup plans that include all SharePoint servers and virtual environments. Simplify full farm rebuilds with a centralized interface and zero-staging VM restore.

Virtualization Platform Assets Protection

DocAve VM Backup and Restore provides flexible backup and recovery for the virtual disks and configuration files of VMware and Hyper-V hosted VMs to protect your entire virtualization platform. Seamless integration with DocAve Backup and Restore for SharePoint enhances your SharePoint backup and recovery plans by ensuring SharePoint server virtual environments are all securely protected.

Technical Overview

- Manage all of your VMs hosted by VMware ESX/ESXi, vCenter, vCentre Host Cluster, vCenter Data Store Cluster, Hyper-V, or Hyper-V Cluster within a single web-based interface, and selectively choose the targets to perform a complete and fast backup
- Store the backup data in net shares or IBM Storwize Family storage devices
- Restore the entire VM with all associated security settings in case of disaster, with the option of powering on the VM after restore
- Allow the in-place or out-of-place restore of individual files or folders rather than the entire VM from the VM backup data to reduce response time for restoring important documents
- Choose to skip, replace, or overwrite during the restore when conflict occurs
- Send real-time notifications to administrators or other stakeholders with job statuses such as success, failure, or warning, as well as detailed job information
- Set up backup and restore plans on a schedule to automatically trigger the job in an off-peak period for the sake of load balancing and network resource optimizing
- Provide a report dashboard for the comprehensive overview of the backup or restore job statuses and counts in a specified period of time

Back up multiple VMs and enable file level restore.
