

DocAve® 6 Software Platform

SP1 CU2

Release Notes

For Microsoft SharePoint
Release Date: December 19, 2012

New Features and Improvements

Platform Backup and Restore

- Reduced memory usage by backup jobs to lessen performance impact on production farms.

Bug Fixes

Connector

- Source folders containing files that have not been synchronized with SharePoint, whether they are system files, hidden files or blocked by SharePoint, can now be properly moved, deleted or renamed.
- Scheduled jobs using .NET Framework's built-in ThreadPool with multiple processes is now supported.

Granular Backup and Restore

- SharePoint Designer workflows can now be properly restored.

Platform Backup and Restore

- Resolved compatibility issue with the AlwaysOn Availability Groups option in SQL Server 2012.
- Backup jobs containing XML files within the SharePoint installation directory containing multiple lines of XML statements no longer causes exceptions in platform backup jobs.

Known Issues

Installation

- If installing a hotfix that contains one or more solution files, an IIS application pool restart will occur on the Web applications that contain those solution files.

Connector

- In certain environments, the **Synchronize** button is grayed out preventing folders from being able to synchronize with the SharePoint Content Library. This is caused by a difference in the JavaScript provided by the .NET Framework and the Connector JavaScript. If you encounter this issue, use the other system's JavaScript instead.
