

DocAve[®] Online 3

Release Notes

Service Pack 4, Cumulative Update 2

Issued June 2014

New Features and Improvements

- Added support for stopping Granular Restore jobs that restore granular data to a storage device.
- In Restore Wizard for both Granular and Exchange Online Backup & Restore, all full backup jobs and incremental backup jobs of the last 7 days are now displayed by default.
- Added the ability to limit the file size of uploaded documents when a user invites support staff to address technical issues (the maximum file size is 5 MB). This feature allows users to attach images while using the headset icon on the upper-right corner of the interface.
- In Job Monitor, users can now filter skipped objects using the Skipped status in Content Manager jobs.

Bug Fixes

- If you navigate to **DocAve Online > Administration > Administrator**, select the **Configuration** tab, select a **Survey** list node on the tree, click **Advanced Settings** or **Validation Settings** on the ribbon to configure and save the corresponding settings, the configurations do not take effect on the selected **Survey** list in SharePoint Online.

Known Issues

- When configuring the physical device of the SFTP storage type and the SFTP server is freeSSHd, testing both the Password and the Private Key File (a .ppk file) at the same time will fail the test. DocAve Online SFTP only supports the private key file in .openssh format. The private key files in .ppk format generated by PuttyGen are not supported. As a workaround, if your private key file is in .ppk format, use PuttyGen to convert it to an .openssh file.
- If the network environment is not stable, the message bar indicating that the job for exporting report is started may not appear. However, the job is actually started and you can view the job in Job Monitor.
- If the SharePoint Online site collection URL contains the special character "~", the storage quota of the site collection cannot be reported in the **Report Center > Administration Report > Configuration Report**. This issue is caused by a SharePoint Online API limitation.
- If a user creates a plan or profile with a name that contains "workflow;open a", an error message appears after saving the plan or profile. The words "workflow;open a" trigger the rule of Windows Firewall.
- DocAve Online only supports users with site collection administrator or above permissions to register SharePoint Online site collections.
- All OneDrive for Business site collections have a storage capacity limit of 1TB.

- DocAve Online does not support restoring the Approval Status of the items in Discussion Board.
- Breaking the inheritance of a list that contains more than 5,000 items through SharePoint Online will fail a job. This issue is due to a SharePoint Online limitation.
- Due to a SharePoint Online client API limitation, the properties of **Number of items to display in list view web part for this view:** and **Field to display in mobile list simple view:** cannot be obtained for backup.
- When configuring a filter policy for the **Number** column with a percentage, the column value must be in a decimal format instead of a percentage in order for the filter policy to be configured correctly and properly run any jobs.
- When merging a source site to a destination site collection, the source site administrator is not promoted to the destination site collection administrator, and therefore the source site administrator cannot access the destination site collection. The source site inherits permissions from its site collection. As a workaround, copy/move all of the source permissions to the destination, and select the source site collection as the source node.
- Office 365 currently does not support restoring folder versions , so discussion subjects are regarded as folders by Office 365. If you perform a Granular Backup to back up a site that contains a discussion board, run a restore job to out of place restore the backed up site to a site collection, and select **Attach** as the **Action**, **Merge** as the **Container level conflict resolution**, and **Overwrite** as the **Content level conflict resolution**, the restore job only restores one item version of the discussion subject to the destination.
- Site language settings cannot be backed up or restored due to a limitation of SharePoint API. **SharePoint API. SharePoint.Client.Web** does not have the AlternateUICultures attribute. For example, if you configure the language settings in a source team site, use Content Manager to attach the source site to a destination site, and set **Merge** as the container level conflict resolution and **Overwrite** as the content level conflict resolution, the source language settings are not copied to the destination.
- Limited Access permission is not supported for restoring due to a Client API limitation. For example, in a source site, if you break the permission inheritance of an item, add a security group, edit the permissions (Limited Access permission is a mandatory selection by SharePoint Online), and use Content Manager to merge the source site to a destination site selecting **Merge** as the container level conflict resolution and **Overwrite** as the content level conflict resolution, the Limited Access permission is not copied to the destination.
- Audit settings are not supported for restoring. The source site collection audit setting cannot be backed up and restored to a destination. Due to limitations of the Client API, **Microsoft.SharePoint.Client.Site**'s attribute of **Audit**, **TrimAuditLog**, and **Site.AuditLogTrimmingRetention** cannot be retrieved during a restore.
- Personal View is not supported because it is a private resource and cannot be accessed by other users. For example, if you select a list as the source node, manually enter the list as the destination node, select **Merge** as **Container level conflict resolution** and **Overwrite** as **Content level conflict resolution** in **Wizard Mode**, select **Include list view**, and then run a copy or move job, the Personal View of the user who does not register site collections is not copied or moved to the destination.
