

File Share Navigator Online

Release Notes

Service Pack 6, Cumulative Update 1

Release Date: June 2017

New Features and Improvements

- General security improvements for enhanced functionality.

Known Issues

- File Share Navigator Online lists cannot be created in modern team site.
Root cause: The scripting capabilities cannot be enabled in modern team sites.
Workaround: You can enable the scripting capabilities on a SharePoint collection manually. Refer to the following link to enable it: <https://support.office.com/en-us/article/Turn-scripting-capabilities-on-or-off-1f2c515f-5d7e-448a-9fd7-835da935584f?ui=en-US&rs=en-US&ad=US>
- When the URL length of folder being synchronized exceeds the threshold, the synchronization will fail.
Root cause: The send request of the synchronization operation has a limit of the request content length, it will truncate the URL if it exceeds the limit, which makes it unable to find the correct folder URL during synchronization.
Workaround: You can modify the **maxQueryStringLength**, **maxUrlLength**, and **maxQueryString** nodes in the **web.config** file to adjust the threshold.
- A File Share Navigator Online list cannot be created in SharePoint Online personal sites.
Root Cause: The setting **Allow users to run custom script on self-service created sites** is disabled by default, which causes this issue.
Workaround: Click the app launcher icon in the upper-left corner in SharePoint Online and select the **Admin** tile. The **Office 365 admin center** appears. In the lower-left navigation, expand **Admin** to select **SharePoint** to open the **SharePoint admin center**. On the **SharePoint admin center** page, under **Custom Script**, select **Allow users to run custom script on self-service created sites** and click **OK** to enable this setting. After the setting takes effect in 24 hours, the File Share Navigator Online list can be created under the personal sites.
- The **Delete** button cannot be hidden in the Item Menu in File Share Navigator Online lists.
Root cause: This is due to a Microsoft API limitation.
- The **Download** button is available and cannot be greyed out when you select a folder in File Share Navigator Online lists.
Root cause: This is due to a Microsoft API limitation.
- The SharePoint Online built-in **New** button is displayed on the ribbon for File Share Navigator Online lists and cannot be hidden.
Root cause: This is due to a Microsoft API limitation.
- When performing the metadata synchronization for the User type, if the user does not exist, the user column synchronization will fail. However, sometimes the synchronization for the columns following the user column in the metadata file will also fail due to the user column synchronization failure.

- File Share Navigation Online fails to perform the metadata synchronization job with metadata file whose name contains non-ASCII characters and has been configured through Excel.
- Root cause: The encoding format of the metadata template file is UTF-8 while the encoding format is changed after the .csv file is configured through Excel. However, when performing the synchronization job, File Share Navigation Online still uses the UTF-8 encoding format to read the file.
 1. After configuring the .csv file with Excel, open the .csv file with **Notepad**.
 2. Select **File > Save As** and select **UTF-8** from the **Encoding** drop-down list.
 3. Click **Save** and click **Yes** to replace the existing .csv file.
 4. Perform the synchronization job again.
- When synchronizing a large number of files via manual synchronization, the job may be timed-out.

Workaround: Use scheduled synchronization instead of manual synchronization.
- When a folder's relative URL against the top-level site is very long, the following actions will fail in this folder as the folder cannot be found: **Synchronize Current Folder, Synchronize Current Folder and Subfolders, Upload Document, Upload Multiple Documents, and New Folder**.
Root cause: The relative URL is too long and must not exceed 255 characters, the folder cannot be found because calling the SharePoint API has truncated the URL.
- A File Share Navigator Online list cannot be created under a site collection that is created automatically by SharePoint Online. This is due to the setting **Allow users to run custom script on self-service created sites** being set to disabled by default. You may apply the following workaround to bypass this setting: Click the app launcher icon in the upper-left corner in SharePoint Online and select the **Admin** tile. The **Office 365 admin center** appears. In the lower-left navigation, expand **Admin** to select **SharePoint** to open the **SharePoint admin center**. On the **SharePoint admin center** page, under **Custom Script**, select **Allow users to run custom script on self-service created sites** and click **OK** to enable this setting. The setting will take effect in 24 hours, and the File Share Navigator Online list can then be created under the default site collection.
