

DocAve Version 4.0.16.1 Release Date: January 24, 2007

Bug Fixes

Server

- From the restore controller browser, if there is a file with "<>" in the attributes, DocAve cannot browse all the files.
- For sub-site level out of place restore, unable to maintain tree structure after restoring a sub-site with all its children sites.*
- License Manager issue: If there are only "Item Level, Site Level, Sub site Level, TrashBin" available in license, cannot access GUI after applying the patch.

Client

- For sub-site level out of place restore, unable to maintain tree structure after restoring a sub-site with all its children sites.*

* Some Notes for sub site level cross restore to restore the sub site structure.

- If the user picks the following sub-sites from the source

`http://server/sites/site/subsite` (selected)

`http://server/sites/site/subsite/sub001` (not selected) `http://server/sites/site/subsite/sub001/sub002` (selected) `http://server/sites/site/subsite/sub001/sub002/sub003` (selected)

The result will be the following:

`http://server/sites/site/subsite`

`http://server/sites/site/sub002`

`http://server/sites/site/sub003`

- Sub-site out of place restore only allows to restore one sub-site structure at a time if promoting the sub-site to a higher level.
