- DocAve 4.1 backup data coalescing.
- Site/ subsite Level Scale Mode.
- PF Migration Enhancement: Support Exchange 2007; Support Job pause and resume.
- Content Manager Enhancement: Support manual input feature; Support multiple sites migration.

Bug Fixes

- Login screen should auto populate active domain
- User defined path cannot be used when doing an out of place restore
- Job Monitor Backup Job Report throws error message when Refresh rate updated
- Client patch always shows "Apply" button even after the patch has been applied
- Grammar Fix "An error when load agents: Your license dose not support item level backup." Changed to "An error when loading agents: Your license does not support item level backup.
- Unable to save a pruning plan in TrashBin
- From DocAve 4.1 GUI Job monitor page, there's no "Archive restore job" now since the feature is not ready now; While when changing the default shown item number from "5" to "10", the "Archive restore job" appears.
- In Small Business Edition, added Data Retention Manager
- Media Service hanging because of special encoding files
- Site locked by AvePoint issue
- Notes lost
- Email Notification Enhancement – error report will be sent if there is a warning in a backup
- Once a document fails to be backed up by Item level backup, it should not be browsed from Restore Controller page
- Adding additional log information to log files along with ID
- Agent type should not be selected by default during Client installation.
- Added additional logic so that if a full backup fails, the related incremental job will not run
- Title error in Log Manager page
- Public Folder 2007 GUI bug
- Item level backup failed but showed completed in Job report
- DocAve4.0.16.0 Item restore problem

- Changed "Restart the Services to take effect for the upgrading?" to "Do you want to restart the services for the changes to take effect?"
- Client side attributes in the file tails too long, cut to less than 32 characters
- Patch Update "Install Later" does not work
- In SharePoint Farm environment (SQL server separated with Front-end server), after running PF migration job, the SharePoint site is unavailable
- Env.cfg file overwritten when 4.0.18.0 client patch is applied
- Site level full backup failed due to out of space, and incremental backup failed, and the restore job failed
