

Release Notes

Product: DocAve® 5.2.2.0

Release Date: August 25th, 2009

Package List: Patch Packages (Manager and Agent); Demo Packages (Manager and Agent)

New Features

Data Protection

- **Support for DPM and STSADM SQL Backups in Restore from SQL**

The Restore from SQL free functionality can now directly read from STSADM and DPM database level backups. DocAve will automatically stage the database for you, without requiring additional steps to load granular content back to SharePoint.

Administration

- **Business Rule Engine in Content Manager**

You can now run recurring schedules in Content Manager in conjunction with advanced business rules (including built in as well as custom metadata) to split content from your most heavily used SharePoint lists and libraries.

- **Security Trimming in Content Manager**

Delegate the responsibilities of your SharePoint content management to your site collection administrators with security trimming in DocAve Content Manager.

- **Move Functionality (Cut & Copy) in Content Manager**

You can now move content to your destination and remove the data from the source in one step.

Report Center

- **Usage Analytics Enhancements**

Monitor all the outstanding SharePoint workflows and their status, examine download ranking for the most popular SharePoint content, study who is contributing the most content, and track potential attacks on SharePoint by monitoring failed log in attempts (with custom alerts available).

- **Infrastructure Report Enhancements**

Monitor all deployed SharePoint Alerts and load times for various sites to keep tabs on your SharePoint performance.

Compliance

- **Export Results from Compliance Hold Manager**

For items placed under legal hold (either on live SharePoint content through eDiscovery or through archives in Compliance Vault), export the data directly from the hold manager for legal review in full fidelity.

Bug Fixes

Data Protection

- **Pausing the SharePoint index crawling for Platform Backup Job**

Run a platform backup job for index database while crawling the SharePoint index, the backup job could not complete in short time caused by unable to pause the SharePoint index crawling.

- **Backing up the Infopath Template**

When using other method to deploy the Infopath template in SharePoint, not upload the form template by SharePoint Central Administration, the infopath template file could not be found and the backup job completed with error.

Report Center

- **Storage Trends on irregular schedules gathered "null" data**

When running reports on SharePoint storage infrequently, days where reporting was skipped typically showed as a "0" point on the final graph or report. This has been corrected to more accurately reflect the trends

- **SQL Reporting Service Configuration with SharePoint Integrated mode**

In SQL 2005 and 2008, whenever the Report Server Mode was set to "SharePoint Integrated", the SQL Reporting Service Configuration could not complete.

Administration

- **Search for SharePoint Groups**

When performing a search in DocAve's Central Admin, the AD search box can now also search on SharePoint groups, including wildcards.

Deployment Manager

- **Restoring the entire GAC Node**

When using Front-End Deployment Manager to move GAC components, the entire GAC could not be selected. It has been fixed and will now prompt a warning before allowing the replacement of the entire GAC.

Known Issues

Administration

- **Promoting a site with a Publishing Template using Content Manager**

When promoting a site using a publishing template to a site collection, the publishing feature will not be enabled automatically, you need to do this from SharePoint.

- **Byte-Level Differencing in Replicator**

Byte Level Differencing cannot be used for content greater than 40 MB. A solution will be provided in the next release.

Data Protection

- **Restoring content while Coalescing**

Any restore jobs to SharePoint will be skipped if the platform is running a data coalescing. We recommend coalescing incremental backups off-hours to prevent overlap.

Migration

- **eRoom Support for Nested Databases**

The eRoom to SharePoint migrator does not yet support nested databases.
