

DocAve® Software Platform

v6.0.1

Release Notes

For Microsoft SharePoint
Release Date: March 20, 2012

New Features and Features

Administration

Central Admin

- Granting permissions and creating groups can now be done in bulk for site collections and sites.

Known Issues

General

Control Panel

- The warning message that the Agent Service will be stopped while upgrading the agent does not yet exist.
- All SQL agents must be upgraded together. Update manager does not support upgrading the SQL agent of Platform Recovery separately when upgrading from DocAve 6.0 to DocAve 6.0.1.

Report Center

- Site collections with space(s) in the URL prevent Failed Login Attempts data from being collected. This issue is limited to DocAve 6.0.1 that was upgraded from DocAve 6.0, and does not apply to freshly installed DocAve 6.0.1.
- After upgrading from DocAve 6.0 to DocAve 6.0.1, if no data is present, an error will pop up when Report Center is launched. To resolve this error, open a new Internet Explorer window or tab > press **Alt+X** to access Tools > select **Internet Options** > click **Delete** in the Browsing history section in the General tab > make sure that the **Temporary Internet files** checkbox is checked > click **Delete** > click **OK**. The cache files from DocAve 6.0 will be removed and the appropriate 6.0.1 files will be generated when you next run DocAve.

Administration

Central Admin

- In SharePoint 2010 December CU environment, after upgrading from DocAve 6.0 to DocAve 6.0.1, Create Container is not supported.

Deployment Manager

- In environments where one farm has multiple agents, deploying custom features does not support the Skip option for conflict resolution. We recommend selecting Overwrite as the conflict resolution method.
- When a file in a library contains a Lookup column which has **Get information from Announcements** and the library is deployed, the Lookup column value is removed.

Content Manager

- SharePoint workflow definition and instance information is not transferring properly in a copy job.

Storage Optimization

Archiver

- Restoring site collections that were archived using DocAve 6.0 using DocAve 6.0.1, the job encounters an exception and an item is not able to be restored. The site collection functions properly otherwise.
- The Lookup column of a list that is associated with another list is not restoring properly after a list rule Archiver job is finished.

Data Protection

Platform Backup and Restore

- In SharePoint 2010 December CU environments, backup jobs including NewsGator are not finishing properly.
- SQL agents installed after a backup plan is created is not being properly recognized in the Restore page after the plan is run if a Web application tree node is selected.

Bug Fixes

General

Installation

- When Manager Service is installed using existing application pool, the original user's configurations should now be kept.

Data Protection

Backup and Restore

- All restored columns should now display the correct values in SharePoint 2010 December CU environments.
