

# Microsoft® SharePoint® Integration with DocAve Connector

Present and manage enterprise documents and media content distributed in legacy storage systems directly in Microsoft SharePoint Server 2019, SharePoint Server 2016, SharePoint Server 2013, and SharePoint Server 2010 without migration.

## Centralized Management of All Enterprise Content Within SharePoint

- **BLOB Utilization** - Attach and connect all enterprise content distributed in legacy storage systems to SharePoint utilizing Microsoft's external binary large object (BLOB) storage and remote BLOB storage APIs
- **Full-featured Management of all Enterprise Content** - All attached content can be managed using all of SharePoint's management and collaboration functions – including versioning, workflows, full-text search, and alerts – as well as DocAve's data protection and management solutions, all as if it was residing directly in SharePoint's SQL Server content database

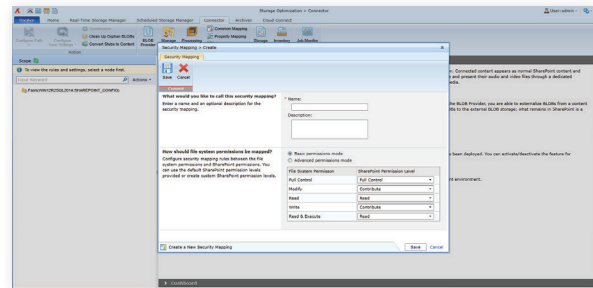

Support for all Network File Shares and Cloud Storage Systems

- **Support for all Network File Shares and Cloud Storage Systems** - Connect any network addressable file share or cloud-based storage system, including Net Share, FTP, Amazon S3, AT&T Synaptic, Dropbox, EMC Atmos, HDS Hitachi Content Platform, IBM Storwize Family, Microsoft Azure Storage, Network File System, OneDrive for Business local folders, and Rackspace Cloud Files directly to SharePoint platforms
- **Comprehensive Document Management** - The attached content can be associated with any of SharePoint's standard and customized metadata fields as well as integrated with SharePoint's native permissions
- **Seamless Integration with SharePoint Search** - All attached content is fully integrated with SharePoint's native, full-text search functionality, as well as all other search tools leveraging standard SharePoint APIs
- **Total Interactivity with Client Office Applications and Third-party Tools** - Attached content can be presented and modified directly through Microsoft Office applications, or acted upon by third-party tools, just as if the content resided in SharePoint's SQL Server content database
- **Automatically Provision Document or Media Libraries** - With the DocAve Connector SDK, administrators can now automatically provision, configure, synchronize, and deploy file share libraries, granting unmatched flexibility to expose file share content in SharePoint
- **Direct Streaming and Preview of Audio/Video Files** - All .wmv, .wma, .mp3, .aac, .vp6, .mp4, .mpeg, .mpg, .avi, and .wav files residing in an attached file share can be directly streamed and previewed for presentation through SharePoint without the need for migration or specific plugins. Dedicated media library caches files through the Content Distribution Network for fast, intelligent delivery

## Flexible Content Synchronization

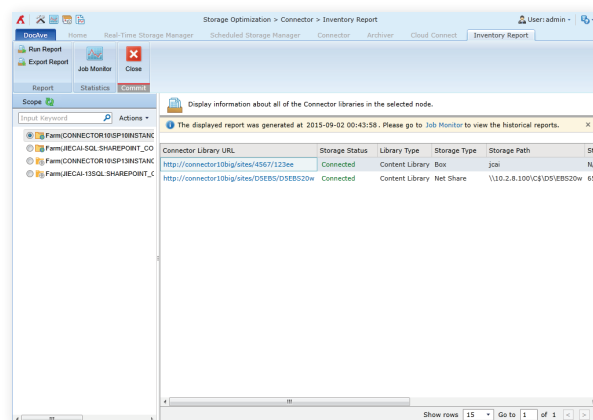

- **Expose Blocked File Types and Large Files from Storage Locations in SharePoint** - Expose blocked file types such as .dll and .exe files, or files that exceed web application's maximum upload size, as links available to view and download without violating Microsoft support contracts – offering truly consolidated access to all enterprise-wide content
- **Customizable Sync Options** - Customize content synchronization options, including one-way or two-way sync; scheduled or on-demand sync; maximum length of file and folder names; illegal characters replacement; version management for the connected files; and property and permission mappings between SharePoint and the connected storage devices
- **Load Permission and Metadata** - Load file properties and access permissions from file shares to SharePoint during synchronization to ensure full fidelity and business continuity. File properties can be reloaded at each synchronization
- **Preserve Source UNC Paths** - Show UNC paths as values in a SharePoint column with specific file types
- **End-user Sync** - Allow end users with proper permissions to synchronize an entire library or even just a single file from the SharePoint interface according to the organizations' specific policies

Security Mapping

## Post-Sync Management

- **Clean Up Orphan BLOBs** - Intelligently detect and remove orphan BLOBs in connected external storage locations to free the occupied storage space
- **Convert Stubs to Content** - Convert business-critical files from stubs to SharePoint entity files in one click
- **Central Dashboard** - Easily track and locate connected libraries using a centralized management console and dashboard for quick insight into the storage connection status, available storage space, connected content size, optimized data size, and orphan stub and BLOB details across SharePoint farms
- **Full Platform Integration** - DocAve Connector is fully integrated with DocAve storage optimization products to clean, archive, and tier legacy data storage systems. Manage file shares with automated, business-rule driven storage policies
